Chilled Water System Design And

Designing chilled water systems Typically used for cooling and dehumidifying a building's air, chilled water (CHW) systems circulate it throughout a building or campus complex. CHW systems also may be used for removing process or other heating loads. By Randy Schrecengost, PE, CEM, Stanley Consultants, Austin, Texas September 16, 2014

Chilled Water Schematics - The Engineering Mindset

Chilled water systems provide cooling to a building by using chilled water to absorb heat from the building's spaces. At the heart of the water chilled system, a chiller removes heat from water by means of a refrigeration cycle. Chillers use the refrigeration cycle to remove heat from chilled water

How a Chilled Water System Works | HVAC Training Shop

Chilled Water System Basics - Chilled water systems in residential HVAC systems are extremely rare. A typical chiller uses the process of refrigeration to chill water in a chiller barrel. This water is pumped through chilled water piping throughout the building where it will pass through a coil.

This minimum rate, which can be obtained from the manufacturer, will vary with design chilled water flow rate and the chiller type, size, and manufacturer but is typically 25% to 50% of the design flow. A VFD is shown in Figure 2 ; VFDs are typically cost effective except on very small systems.

Optimizing Design & Control Of Chilled Water Plants

Mechanical engineers who design chilled water plants are the target audience for the guide. All of the material in the guide is relevant to this group, although experienced engineers can briefly review Chapter 2 on loads and Chapter 3 on equipment and then refer to this material as necessary.

Applications Engineering Manual

The principal objectives of chilled water pumping system selection and design are to provide the required cooling capacity to each load, to promote the efficient use of refrigeration capacity in the plant, and to minimize pump energy consumption subject to whatever budgetary constraints may apply.

HVAC Chilled Water Distribution Schemes

Chilled water systems also use the basic refrigeration cycle but instead of cooling the air directly, chilled water systems cool water which in turn cools the air. The condenser side of a chilled water system can be either air-cooled or water-cooled. Air-cooled chillers must be located outdoors in order for the condenser to reject heat.

Multiple-Chiller-System Design and Control

Many large buildings, campuses, and other facilities have plants that make chilled water and distribute it to air-handling units (AHUs) and other cooling equipment. The design, operation, and maintenance of these CHW plants has a very large impact on building energy use and energy operating cost.

When running building, try to get your condenser water as low as possible when running. But stay above 65°F (18.33°C). Anytime you can provide condenser water lower than the design of 85°F (29.44°C) you will lower your condenser pressure and lower the lift (cond pressure - evap pressure).
